

Origin of cancer:

Fat is a major cause of cancer. Some diseases have been linked to diets high in oils and fried meats, while many organic or so-called healthy foods are prepared with water that contains no harmful substances. However, claiming that the body needs oil is incorrect: dietary fats are detrimental to human health. For doctors, it is not in their interest to disclose the true origin of cancer. Doing so would prevent them from keeping patients locked into paying for ongoing treatment, which generates bureaucratic revenue. Patients will always choose treatment if they want to live. Physical life depends on functioning organs. Cigarettes and alcoholic beverages damage the lungs and kidneys, leading to physical death, yet both are legal products. Similarly, fatty foods are not true nourishment, and sugary products are always harmful. The human body is delicate, and the organs are even more so. They cannot tolerate fat at any time. It is not normal to have two categories of food in stock: fatty foods that cause death and organic foods that do not. Fatty food may taste appealing, but eating it leads to mortality. The appeal creates a slow, socially acceptable addiction. Fatty food is not immediately deadly because it is mixed with organic ingredients. The fat enters the bloodstream and affects the organs over time. Because death is not instant, consumers are convinced that it has no fatal effect and that it is a staple food. Meanwhile, the body is pushed toward chronic illness and fatal cancer. Anything containing fat is deadly. It remains legal because governments are aware that it is fatal over time. It kills people through obesity, cancer, diabetes, and organ failure. Fatty food is designed to kill organs in exchange for rich flavor. Because organs sustain life, killing the organs kills the person. People die of cancer due to a history of consuming fatty food, which is not suitable for human consumption. That is why it is fatal. Organic food does not cause this type of mortality because it contains no fat and is truly fit for human consumption. The truth is that cancer is not inherited unless a man has cancer and passes it to the fetus through semen. Otherwise, it is not inherited. Cancer at birth, in this argument, results from the fetus absorbing fatty foods. Fatty food is not suitable for human consumption.

Some people who eat fatty foods never develop cancer, while others do, even though getting cancer is often portrayed as normal. The difference lies in the immune system: some individuals have weaker immune systems and develop cancer earlier than others. Having a strong immune system does not guarantee that a person will avoid cancer; it may simply delay onset. Those who smoke cigarettes, eat fatty foods, and use drugs are extremely vulnerable to cancer, and even a strong immune system may not offset the damage caused by these harmful habits. Cancer can be still silent and take longer to develop in people with strong immune systems who eat fatty foods, but avoid alcohol and cigarettes. Cancer tends to develop in old age, often following a long history of consuming fatty foods. As organs age, the effects of fatty foods are more likely to contribute to cancer in those organs. In older individuals, cancer is often aggressive and has a very high mortality rate. Normally, people should experience few health problems when they eat organic foods. Organic foods do not cause mortality, and they help preserve physical appearance. By contrast, fatty and extremely hot foods burn organs and accelerate visible aging. Consuming foods with oil weakens immune defenses. That is why people get sick constantly. Symptoms that appear in people who have consumed food with oil, often due to advertising or flavor, include dizziness, nausea, vomiting, and headache. These symptoms occur because the body is intoxicated and poisoned. These symptoms usually disappear soon after a person switches to organic food. Doctor visits become rare because the body is healthy and its defenses are strong. Food with oil only pretends to be healthy in commercials. The truth, is that it is deadly and a cause of cancer. Cravings for fatty foods take much longer to disappear. The desire to eat fatty foods can remain strong for one to six years as the body and mind adjust. Resisting and avoiding places where the smell of fatty food is present is the way to eliminate that appetite for deadly food with oil. All diseases remain hidden when their effects are not immediate. Smoking a pack of cigarettes does not cause death in the present. The government is aware that products like alcohol, fatty foods, and cigarettes have deadly effects. They are a sweet poison created by others that kills people. The government, it claims, **prefers to keep money moving and legalizes** them for that reason. It does not care about the lives of the people who consume them, who become secret victims.

Anything that appears appealing but proves deadly or fraudulent in its effect is designed to attract victims through appearance. One example is fatty food, which hides its deadly effect with rich flavor. This all begins because money is a fraudulent way to live physical life. That is why it moves by force and only through unnatural fabrications. Money leads people to manufacture fraudulent things to obtain it. The evidence, includes food trucks, restaurants, fast food, and bars that serve alcohol. They appear normal but are fraudulent because politicians created money and legalized these businesses regardless of the deadly effects they cause: cancer, diabetes, obesity, and more. These businesses exist only to make money. They are not concerned with the deadly effect their products have on people because money has no feelings. Drugs override the body's natural function and make it dependent on the drug. The first times a person uses drugs, the body rejects the toxic substance. But when people ignore that rejection and continue using, they lose control and become dependent. Control is lost because drugs eliminate the body's natural, automatic functions and replace them with drug dependence. That is why no one has control over drugs. Drug use also causes cancer in different parts of the body. Laws do not protect public health if they protect people's lives. If they did, cigarettes, fatty foods, and alcoholic beverages would not be legal for sale. Chronic disease, has its origins in the legal products mentioned above. Fatty foods demonstrate that legal approval can be misleading and dangerous when people rely on laws enacted by policymakers who do not assess the consequences of legalizing such products. Diets high in saturated and trans fats are linked to an increased risk of cancer, including in individuals who do not smoke, consume alcohol, or use drugs. Because these foods are eaten daily, often multiple times per day, the effects on the body can accumulate over time. Cancer is subsequently diagnosed in individuals who eat fatty foods regularly and believe the foods are harmless because they taste good. These individuals are unaware that daily consumption, starting with breakfast, is associated with a higher risk of cancer. These factors explain the prevalence of highly processed, commercialized fatty foods. Marketing strategies that promote flavor and palatability can obscure potential health risks, turning consumers into unwitting victims of products presented as appealing while their adverse **effects are downplayed.**

The physical evidence of the hidden effects behind:

Some products appear healthy but cause death through the rich feeling of drugs, the effects of alcohol, or the taste of greasy foods. Those consequences include cancer. That is the origin of cancer described here. It does not matter whether the products are legal. If they are not natural or organic, they are harmful. Any consumption that is not natural or organic can have a deadly effect over time. People may feel fine at first, but the effect develops slowly and can cause cancer anywhere in the body because blood circulates throughout the body.

Cancer fatty food and others:

Cancer alcohol:

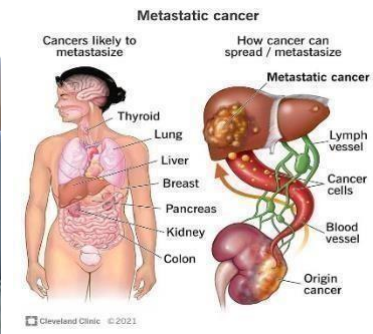

Cancer fatty food:

Cancer drugs and marijuana:

Cancer cigarettes:

Legal product cancer:

Any consumption that is not natural and organic is, in this view, fraudulent. People are eating fraudulent foods, primarily fatty foods, which create cancer in the body. Because they are fraudulent, fatty foods are everywhere. The hidden effect is to pressure people to consume them when they are hungry and the only available option is fast food, which is also fatty and carcinogenic. On the surface they appear beneficial, but their actual effects are the opposite. It is harm disguised as help, with consequences that can be devastating.

Physical evidence:

You can distinguish fraudulent food from real organic food by popularity and promotion. Greasy food is more popular and more heavily promoted because it is fraudulent. Because it is fraudulent, it is deadly and carcinogenic due to its effects after consumption.

Fraudulent fatty food:

Fraudulent fatty food:

Fraudulent fatty food:

Alcohol, Drugs, Main fatty food, Cancer:

Today, children and families often think fatty foods are normal because parents eat them and give them to their children. They assume the foods are not fraudulent because they are legal, no immediate harm occurs, and they still feel fine. The reality, according to this text, is that feeling good and sometimes bad happens because fatty foods are fraudulent. They try to kill people with their delicious flavors. Feeling unwell results from past consumption that is now trying to cause cancer, obesity, or other conditions. Feeling well occurs because “abstract existences” protect people from becoming victims of hidden deadly effects, making it seem to victims that this consumption is normal. The only real food for humans is organic because it is natural and has no deadly effects. The difference between fraud and non-fraud is the effect: fatty foods are deadly; organic foods are not. Fatty foods also make young people look older because the foods damage their organs. Cancer does not occur without an origin. It cannot develop silently without a cause, and that cause is fatty foods and other unnatural substances which become carcinogenic over time. It is legal. It tastes good, so we eat it. That taste marks the onset of cancer and the chronic diseases that develop as an effect. The taste is the trap.

Conclusions:

Some people allege that certain doctors know the real cause of cancer but do not disclose it because they earn income from treating illness. When patients ask, "What causes cancer?" doctors provide different answers. One doctor says, "There is no single cause." Another says, "Fatty foods do not cause cancer." A third says, "Do not worry about it. Eat whatever you like." The following confirmation is provided: doctors deliver these answers in a calm, reassuring tone so that patients feel safe and continue eating foods that the source describes as carcinogenic. As a result, patients continue to develop cancer, and doctors continue to earn money from treatment. The confirmation presented here is that doctors whose income depends on illness have no incentive to reveal what they supposedly know. Instead, they speak in a way that sounds credible, which discourages patients from changing their diets. This confirmation contends that if fatty foods were not a major cause of cancer, cancer would not exist. Related conditions and other illnesses linked to cancer would not exist either. The confirmation describes fatty foods as junk food and asserts that eating them for 20 to 30 years harms health and leads to cancer. Cancer often appears suddenly after decades, so people do not connect it to their long-term diet. The confirmation states that this delay misleads people. They think, "If fatty foods had caused cancer, I would have become ill many years ago. They can't be the cause." **People don't blame the food because it tastes good.** However, according to this confirmation, the taste is deceptive. The food is deadly and is a primary cause of cancer. The text also offers confirmation that legal does not mean safe. Fatty foods are legal to manufacture and sell, but that does not make them harmless. Many people assume the government would not allow a product that causes cancer. However, the law does not prohibit fatty foods, which this confirmation calls deadly. The source further provides confirmation that politicians either do not understand the risk or do not prioritize public health. Their focus is economic growth, even if a product harms people. Therefore, legal status should not be treated as proof of safety. According to this confirmation, these laws contribute to preventable deaths, with fatty foods cited as the main example. The government perpetuates a hidden deception by valuing appearances over consequences. No one is prosecuted for these deaths because the products are lawful.
